

## A.14 The BBS Sequence for Superspecial BLUM Integers

Again we get the most satisfying results in the superspecial case:

**Definition** A **superspecial BLUM integer** is a product of two different superspecial primes.

**Examples** The two smallest superspecial primes are  $p = 23$  (with  $p' = 11$ ,  $p'' = 5$ ) and  $q = 47$  (with  $q' = 23$ ,  $q'' = 11$ ). Thus the smallest superspecial BLUM integer is  $n = 23 \cdot 47 = 1081$ . By Section [2.1](#) we are confident (however don't know for sure) that there are very many superspecial BLUM integers.

Now let  $n = pq$  be a superspecial BLUM integer with  $p = 2p' + 1 = 4p'' + 3$  and  $q = 2q' + 1 = 4q'' + 3$ . Form the BBS sequence [\(1\)](#) for an initial value  $x \in \mathbb{M}_n^2 - \{1\}$ . Then  $s = \text{ord}_n(x)$  takes one of the values  $p'$ ,  $q'$ , or  $p'q'$ , the last on with extremely high probability, and the first two may be excluded by an easy check. The period of the BBS sequence is  $\nu = \text{ord}_s(2)$  by Proposition [26](#), and we may assume that  $s = p'q'$ . By the chinese remainder theorem and Lemma [21](#)

$$\nu = \text{lcm}(\text{ord}_{p'}(2), \text{ord}_{q'}(2))$$

By the Corollary of Proposition [23](#) in Section [A.9](#)

$$\begin{aligned} \text{ord}_{p'}(2) &= \begin{cases} 2p'' & \text{if } p'' \equiv 1 \pmod{4}, \\ p'' & \text{if } p'' \equiv 3 \pmod{4}, \end{cases} \\ \text{ord}_{q'}(2) &= \begin{cases} 2q'' & \text{if } q'' \equiv 1 \pmod{4}, \\ q'' & \text{if } q'' \equiv 3 \pmod{4}, \end{cases} \end{aligned}$$

Thus finally we have shown:

**Proposition 27** *Let  $n$  be a superspecial BLUM integer. Let  $x$  be a quadratic residue mod  $n$  with  $x \not\equiv 1 \pmod{p}$  and  $x \not\equiv 1 \pmod{q}$ . Then the BBS sequence mod  $n$  for  $x$  has period*

$$\nu = \begin{cases} p''q'' & \text{if } p'' \equiv q'' \equiv 3 \pmod{4}, \\ 2p''q'' & \text{otherwise.} \end{cases}$$

If  $p''$  and  $q''$  are  $(l-2)$ -bit primes (hence  $> 2^{l-3}$ , and  $n$  is an  $l$ -bit integer), then the period is  $> 2^{l-2}$  or about  $n/4$ .
